

UV-C Light against Viruses for more safety on board

This bus is equipped with a new technology for air sterilization.

- UV-C radiation against all viruses – including coronaviruses as well as mold, bacteria and odors
- Over 95% of viruses are inactivated within minutes
- Contaminated air is continuously drawn in and disinfected
- Purified air flows continuously back into the passenger compartment
- Virus concentration in the bus is kept low, even if there are infected persons on board
- Disinfection of air by UV light is a long proven technology

The effectiveness of the UV-C lamps was confirmed together with the Institute for Medical Virology of the University Hospital Frankfurt on the basis of tests with the Corona virus.

Please note: Compliance with the hygiene regulations is still required; the system does not prevent direct droplet infection!

We wish you a good journey!
